

MASTER PRODUCT BLUEPRINT

Global Accounting & Invoicing Platform

V1 — Full Pre-Release Product Definition

Working product name: TBD | Platform: Responsive Web App | Market: Global | Payments: Deferred until post-V1

Prepared as the single source of truth for product strategy, UX design, architecture, engineering, QA and launch readiness.

Version 1.0 • 15 August 2026

1. Executive Summary

The product is a global, multi-tenant accounting and business-finance web application for freelancers, consultants, agencies, small businesses and growing teams. V1 is intentionally broader than a simple invoice generator: it launches with sales, purchases, double-entry accounting, banking and reconciliation, inventory, projects and time, reporting, automation, portals, collaboration, global localization infrastructure, platform administration and an AI-ready foundation.

Product principle: make accounting powerful enough for professionals, but understandable enough for a business owner who is not an accountant.

Online payment processing is explicitly out of scope for V1. Users can still record cash, bank transfer, cheque and other offline/manual payments against invoices and bills. The data model and service boundaries must preserve a clean future path for payment gateways.

V1 launch outcome

- A new organization can configure its business, tax, fiscal, currency and document settings.
- A user can manage customers and vendors, issue quotes, sales orders, invoices and credit notes, and record payments.
- A business can capture expenses, bills, purchase orders and vendor credits.
- Every accounting-impacting transaction posts through a controlled double-entry ledger.
- Users can import bank statements, match transactions and reconcile accounts without live bank-feed integrations.
- Product businesses can manage stock and warehouses; service businesses can manage projects, time and billable work.
- Owners and accountants can produce core financial, tax, receivables, payables, inventory and project reports.
- Organizations can collaborate through roles, approvals, audit trails and customer/accountant access.
- The platform can support multiple countries through configuration rather than country-specific forks.

External product benchmark

Zoho Books is used as a capability benchmark rather than a design to copy. Its current product surface includes receivables, payables, inventory, projects, banking/reconciliation, accounting, automation, portals, multi-currency, reports and country-specific compliance. The proposed V1 deliberately covers the same broad business-finance categories while establishing an independent UX and architecture.

2. Product Vision & Positioning

Vision

The global financial operating system for small businesses: invoice, account, reconcile, understand and control the business from one place.

Core value proposition

Pillar	Promise
Simple	A business owner can complete common tasks without understanding accounting terminology.
Complete	V1 covers the operating loop from sale/purchase through ledger and reporting.
Global	Currencies, tax concepts, fiscal settings, formats and compliance metadata are configurable.
Trustworthy	Immutable accounting history, approvals, auditability, backups and tenant isolation are foundational.
Extensible	Payments, e-invoicing, bank feeds, payroll and third-party integrations can be added without rewriting the core.

Primary personas

Persona	Primary needs	Success signal
Solo professional	Invoice, expenses, simple reports, tax visibility	First invoice in minutes; books remain understandable
Small-business owner	Sales, purchases, stock, cash flow, staff controls	Daily financial picture without spreadsheets
Finance/admin staff	High-volume entry, approvals, reconciliation	Fast processing with fewer errors
Accountant/bookkeeper	Ledger, journals, closing, reports, multi-client access	Reliable books and audit trail
Project/service manager	Projects, time, expenses, profitability	Billable work converts cleanly to revenue
Customer	Quotes, invoices, statements, downloads	Can self-serve documents and status

Positioning

Category: cloud accounting and business-finance software. Entry message: invoicing and business control. Retention engine: accounting, workflows, reporting and operational history.

Non-goals for V1

- No card/mobile-money/online gateway processing.
- No automated bank feeds; statement import and reconciliation are included.
- No payroll engine.
- No marketplace/e-commerce connectors.
- No statutory filing submission unless a country pack can support it without an external integration.
- No attempt to encode every country's tax law before launch; V1 provides a scalable localization framework plus selected launch packs.

3. Complete Product Architecture

Domain	Modules
Foundation	Authentication, organizations, members, roles, permissions, preferences, numbering, currencies, taxes, fiscal periods, audit
Sales	Customers, quotes, sales orders, invoices, recurring invoices, credit notes, receipts, customer statements
Purchases	Vendors, expenses, bills, recurring bills, purchase orders, vendor credits, payments made
Accounting	Chart of accounts, journal engine, general ledger, AR/AP, opening balances, period locks, FX adjustments
Banking	Cash/bank accounts, statement import, matching, categorization, transfers, reconciliation
Inventory	Items, stock movements, warehouses, adjustments, reorder levels, valuation
Projects	Projects, tasks, timesheets, billable expenses/time, budgets, profitability
Reporting	Financial statements, operational reports, tax, aging, inventory, project, audit and exports
Automation	Recurring transactions, reminders, approvals, rules, scheduled reports, notifications
Collaboration	Customer portal, accountant access, comments, attachments, activity history
Platform	Plans/entitlements, tenant admin, localization, feature flags, support tools, system analytics
AI-ready	Document extraction pipeline, natural-language analytics, anomaly/insight framework, guarded actions

Core transaction chain

Quote → Sales Order → Invoice → Payment Record → Ledger → Bank Match/Reconciliation → Financial Reports

Purchase Order → Bill/Expense → Payment Made → Ledger → Bank Match/Reconciliation → Financial Reports

All finalized financial documents must be ledger-aware. A PDF is an output of a transaction, never the transaction itself.

4. Roles, Permissions & Governance

Role	Default scope
Organization Owner	Full organization control, billing/plan, users, settings, closing and destructive actions
Administrator	Operational configuration and broad module access; no ownership transfer by default
Accountant	Accounting, journals, reconciliation, reports, opening balances and period close
Sales	Customers, items, quotes, orders, invoices; restricted accounting access
Purchases	Vendors, purchase orders, bills, expenses
Inventory Manager	Items, warehouses, adjustments, stock reports
Project Manager	Projects, tasks, budgets, time and project billing preparation
Timesheet User	Own assigned projects/tasks and time entries
Viewer/Auditor	Read-only scoped access
Customer Portal User	Own customer documents only

Permission model

- RBAC with module + action permissions: view, create, edit, submit, approve, void, delete, export and manage.
- Record-level ownership/scoping where useful, e.g. own projects or assigned customers.
- Maker-checker/approval policy can be enabled by transaction type and threshold.
- Sensitive actions require re-authentication where appropriate: ownership transfer, period unlock, user privilege elevation, data export.
- No hard deletion of posted accounting transactions. Use void/reversal patterns with complete audit history.

5. Information Architecture & Screen Inventory

Primary navigation

Section	Screens
Overview	Dashboard, activity, tasks/approvals
Sales	Customers, Quotes, Sales Orders, Invoices, Recurring Invoices, Credit Notes, Payments Received, Customer Statements
Purchases	Vendors, Expenses, Bills, Recurring Bills, Purchase Orders, Vendor Credits, Payments Made
Banking	Accounts, Imported Transactions, Matching, Reconciliation, Transfers
Accounting	Chart of Accounts, Manual Journals, Recurring Journals, Opening Balances, Fiscal Periods, Currency Adjustments
Items	Products & Services, Price Lists, Inventory Overview, Warehouses, Adjustments, Stock Movements
Projects	Projects, Tasks, Timesheets, Approvals, Project Expenses, Profitability
Reports	Report Library, Saved Reports, Scheduled Reports
Documents	Files/Attachments, Templates
Automation	Rules, Recurring Transactions, Reminders, Approvals, Notifications
Settings	Organization, Users/Roles, Currencies, Taxes, Numbering, Templates, Emails, Localization, Data & Security

Global quick-create

- Customer
- Vendor
- Quote
- Sales order
- Invoice
- Credit note
- Expense
- Bill
- Purchase order
- Payment received
- Payment made
- Journal
- Product/service
- Project
- Time entry

Key detail-screen pattern

Header/status → primary actions → summary totals → line items/data → related transactions → attachments/comments → accounting impact → audit/activity timeline.

6. Critical User Journeys

Onboarding

Sign up → verify identity/email → create organization → choose country/base currency/fiscal year → tax setup → document numbering → optional opening balances/import → invite team → dashboard.

Invoice lifecycle

Customer → invoice draft → line items/tax/discount → preview → approve if required → issue/send → partial/full manual payment → receipt → ledger update → statement/report.

Quote to cash

Quote → customer acceptance recorded → convert to sales order or invoice → fulfil/service → invoice → payment → reconciliation.

Purchase to pay

Vendor → purchase order → receive/record bill → approval → payment record → bank match → reconciliation.

Expense

Capture expense → category/account → tax → attachment → approval → ledger → bank match.

Bank reconciliation

Create bank account → import CSV/OFX/QIF where supported → normalize → match/categorize/transfer → reconcile statement closing balance → lock reconciliation.

Inventory sale

Item/warehouse → sales transaction → stock issue → COGS/asset posting according to valuation policy → stock and margin reports.

Project billing

Project → tasks/budget → time/expense → approval → billable selection → invoice → project profitability.

Period close

Review unreconciled items → run trial balance → adjustments → FX revaluation → lock period → reports → controlled unlock if authorized.

7. Design System & UX Principles

UX principles

Principle	Application
Progressive disclosure	Show business language first; expose accounting detail when needed.
One clear primary action	Every screen should have a dominant next action.
Status clarity	Draft, sent, overdue, partially paid, paid, void, approved and reconciled must be unmistakable.
Explain consequences	Before posting/voiding/locking, explain the financial effect.
Fast data entry	Keyboard-friendly forms, remembered defaults, inline customer/item creation and bulk actions.
Safe automation	Preview rules; approvals and audit trail for material financial actions.
Responsive first	Desktop-optimized finance workflows with usable tablet/mobile responsive views.
Accessibility	Target WCAG 2.2 AA patterns: focus, labels, contrast, keyboard operation and semantic tables/forms.

Design system foundation

- Tokens: color, typography, spacing, radii, elevation, motion and density.
- Components: buttons, inputs, selects, date/currency fields, data tables, status chips, drawers, modals, steppers, tabs, empty states, toasts.
- Finance components: money input, tax selector, line-item editor, totals panel, exchange-rate control, account picker, reconciliation matcher, report filters.
- Patterns: create/edit transaction, approval, void/reverse, import wizard, bulk selection, advanced filter, export, audit timeline.
- Document templates are separate from application UI themes.

8. Recommended Technical Architecture

Reference stack

Layer	Recommendation	Reason
Web frontend	Next.js + TypeScript	Mature React ecosystem, SSR where useful, strong component architecture
API/backend	NestJS + TypeScript	Modular domain services, validation, background jobs and enterprise patterns
Database	PostgreSQL	Relational integrity and transaction semantics suit accounting
ORM	Prisma or TypeORM (team decision)	Typed data access; use explicit SQL for critical reporting/ledger paths where needed
Cache/queues	Redis + BullMQ	Jobs for PDFs, emails, imports, recurring transactions and report generation
Object storage	S3-compatible storage	Receipts, attachments, generated PDFs and exports
Email	Provider abstraction	Avoid hard dependency; transactional templates and delivery events
Observability	OpenTelemetry + logs/metrics/error tracking	Trace financial workflows and background jobs
Deployment	Containerized services	Portable cloud deployment and predictable environments

Service boundaries

- Identity & Access
- Organization & Entitlements
- Contacts
- Catalog
- Sales
- Purchases
- Ledger/Accounting
- Banking/Reconciliation
- Inventory
- Projects/Time
- Tax & Localization
- Documents
- Automation/Workflow
- Reporting
- Notifications
- Platform Administration

Start as a modular monolith unless scale proves otherwise. Keep strong domain boundaries and events so high-load services can be extracted later.

Non-negotiable engineering controls

- Every tenant-owned row carries organization_id; enforce tenant scoping in application and database patterns.
- Use database transactions for posting workflows.
- Idempotency keys for posting/import/recurring jobs.

- Immutable journal lines after posting; corrections use reversal/adjustment.
- Store monetary amounts as fixed precision decimals, never binary floating point.
- Store timestamps in UTC while preserving transaction-local dates/time zones where legally relevant.
- Version tax/configuration references used by finalized transactions.
- Generate PDFs from immutable snapshots of issued documents so later template/customer changes do not rewrite history.

9. Core Data Model

Domain	Core entities
Identity	users, sessions, auth_methods
Tenancy	organizations, organization_members, roles, permissions, invitations, subscriptions/entitlements
Localization	countries, currencies, exchange_rates, tax_regimes, tax_rates, fiscal_years, number_sequences
Contacts	contacts, contact_addresses, contact_tax_ids, contact_people
Catalog	items, item_prices, units, categories, warehouses
Sales	quotes, quote_lines, sales_orders, sales_order_lines, invoices, invoice_lines, credit_notes, payments_received, allocations
Purchases	purchase_orders, bills, bill_lines, expenses, vendor_credits, payments_made, allocations
Accounting	accounts, journal_entries, journal_lines, accounting_periods, opening_balances, posting_batches
Banking	financial_accounts, statement_imports, bank_transactions, matches, reconciliations
Inventory	stock_movements, stock_lots(optional), inventory_adjustments, valuation_layers
Projects	projects, project_tasks, time_entries, project_expenses, project_budgets
Workflow	approval_policies, approval_requests, workflow_rules, scheduled_jobs, notifications
Documents	attachments, generated_documents, templates
Audit	audit_events, security_events, data_exports

Ledger model

journal_entries represent a business event; journal_lines contain debit/credit amounts by account. A posted entry must balance in its accounting currency. Source documents link to posting batches/journal entries. Reports derive from the ledger, not from invoice totals alone.

Example posting rules

Event	Debit	Credit
Issue invoice	Accounts Receivable	Revenue + tax payable as applicable
Record customer payment	Bank/Cash	Accounts Receivable
Record vendor bill	Expense/Inventory/Asset + recoverable tax	Accounts Payable
Pay vendor bill	Accounts Payable	Bank/Cash
Inventory sale	Cost of Goods Sold	Inventory Asset
Credit note	Revenue/Tax reversal	Accounts Receivable or customer credit

10. Accounting Engine Specification

- Configurable chart-of-accounts templates by country/business type; organizations can add subaccounts subject to system-account protections.
- Accrual accounting as the primary ledger model; architecture should allow cash-basis reporting views where legally/operationally appropriate.
- AR/AP subledger tied to contacts and source documents.
- Draft vs posted transaction states; posting is an explicit controlled transition.
- Opening balances wizard with balancing validation.
- Manual and recurring journals with approval controls.
- Fiscal years and accounting periods; soft close and hard lock.
- Base currency plus transaction currency; store transaction amount, base amount and applied rate.
- Realized and unrealized foreign-exchange gain/loss support.
- Rounding policy and dedicated rounding account.
- Reversal entries and void flows rather than destructive edits.
- Audit trail records actor, timestamp, source, before/after material fields and reason where required.

Accounting acceptance criteria

- No posted journal entry can be unbalanced.
- No posted transaction can be silently deleted or rewritten.
- AR/AP aging totals reconcile to control accounts.
- Trial balance debits equal credits for every organization and reporting cutoff.
- Period locking prevents backdated posting except through authorized unlock/adjustment policy.
- Foreign-currency reports reconcile to stored base-currency postings.

11. Globalization & Compliance Architecture

Global readiness is a configuration architecture, not a promise that every jurisdiction is fully compliant on day one. Each launch country must undergo tax/accounting/legal review before being marketed as compliant.

Country pack model

Configuration area	Examples
Identity	country code, legal entity types, tax-ID labels and validation patterns
Formatting	date, number, currency display, address and phone formats
Accounting	default chart template, fiscal-year defaults, rounding rules
Tax	tax names, inclusive/exclusive behavior, rates, exemptions, reverse-charge metadata
Documents	required invoice fields, numbering constraints, legal footer fields
Reporting	tax report layouts and local report labels
E-invoicing readiness	structured document schema, external IDs, submission status model

E-invoicing readiness

The transaction model should preserve structured invoice data separately from PDFs. This is important because e-invoicing adoption is expanding. OpenPeppol publishes active country profiles across Europe and markets including Australia, Japan, Malaysia, New Zealand and Singapore. The EU VAT in the Digital Age package is being phased in through 2035, with cross-border B2B digital reporting requirements from 1 July 2030.

Recommended launch-pack strategy

- Tier A: fully reviewed launch countries with localized tax/document behavior.
- Tier B: generic country support using configurable taxes/currency but no compliance claim.
- Tier C: unsupported jurisdictions blocked from compliance-sensitive setup until reviewed.
- Country pack versioning: finalized transactions retain the rules/version active when issued.

12. Functional Requirements by Module

Sales

- Customer profiles and contacts
- Quotes with statuses, expiry and conversion
- Sales orders and fulfilment status
- Invoices with line items, taxes, discounts, shipping/adjustments, due dates and attachments
- Recurring invoice schedules
- Credit notes and allocations
- Manual/recorded payments including partial payments
- Customer statements and aging
- PDF/email issue workflow
- Approval before issue where configured

Purchases

- Vendor profiles
- Purchase orders
- Bills and bill lines
- Expenses with receipt attachments
- Recurring bills/expenses
- Vendor credits
- Payments made and allocations
- Approval workflows
- Expense categories mapped to accounts

Banking

- Cash/bank/credit-type accounts
- CSV import plus extensible import adapters
- Duplicate detection
- Match to payments/expenses/transfers
- Split/categorize transaction
- Bank rules
- Reconciliation by statement period
- Reconciliation history and controlled undo

Inventory

- Stock/non-stock/service item types
- Warehouses
- Opening stock
- Receipts/issues/transfers
- Adjustments with reason
- Reorder points
- Valuation policy selected at organization setup where supported
- COGS posting
- Stock-on-hand and valuation reports

Projects & Time

- Projects and customers
- Tasks and assignees
- Budgets by money/hours
- Timers/manual entries
- Approval
- Billable/non-billable status
- Project expenses
- Invoice generation from approved billables
- Profitability

Reports

- P&L
- Balance Sheet
- Cash Flow
- Trial Balance
- General Ledger
- Journal Report
- AR/AP Aging
- Sales by customer/item
- Expense/Purchase reports
- Tax summary/detail
- Inventory valuation/movement
- Project profitability
- Audit log
- Custom filters, comparison periods, export and saved views

13. Automation, Collaboration & AI-Ready Layer

Automation

- Recurring invoices, bills, expenses and journals.
- Due/overdue invoice reminders without payment links in V1.
- Approval policies by module, amount, creator, department/tag or role.
- Rule engine: trigger → conditions → actions; begin with safe actions such as notifications, field updates and task creation.
- Scheduled reports by email.
- Failed-job dashboard and retry controls for administrators.

Customer portal

- View/download quotes and invoices
- Record acceptance/rejection of quotes
- View credit notes and statements
- View payment status/history
- Download receipts
- Update permitted contact details
- No online checkout in V1

Accountant collaboration

- Accountant role independent from paid operational seats if business model permits
- Multi-organization switcher
- Read/write accounting permissions
- Period close workflow
- Comments/requests and audit visibility

AI-ready capabilities

- Receipt/document extraction pipeline with user confirmation before posting.
- Natural-language report query over permission-filtered organization data.
- Explain-this-number interactions that trace report totals to underlying transactions.
- Anomaly/variance insights as advisory signals, never autonomous ledger edits.
- Draft assistance for descriptions, reminders and categorization suggestions.
- All AI financial actions must be reviewable, attributable and permission-aware.

14. SaaS Platform Administration

Area	Capabilities
Organizations	Search, status, plan, country, usage, owner, support metadata
Users	Account status, organization memberships, security events; no casual access to tenant financial data
Plans	Feature entitlements, limits, trials, grandfathering and future billing hooks
Localization	Country packs, currencies, tax definitions, templates and release versions
Feature flags	Global, country, plan and tenant-scoped rollout
Support	Impersonation only if implemented with explicit authorization, banner, reason, expiry and audit; safer read-only support tools preferred
Operations	Job queues, email delivery, document generation, imports, error rates
Security	Suspicious events, admin actions, exports, privilege changes
Analytics	Activation, invoice creation, reconciliation adoption, retention and module usage without exposing customer-sensitive content

15. Security, Privacy & Reliability

- TLS in transit and strong encryption at rest through infrastructure controls.
- Password hashing using modern adaptive algorithms; MFA support and recovery controls.
- Secure session rotation, CSRF/XSS/SQL-injection defenses and strict validation.
- Least-privilege service/database credentials and secrets management.
- Tenant-isolation tests as a release gate.
- Rate limiting and abuse controls on authentication, exports and public portal endpoints.
- Malware scanning/validation for uploaded files where feasible.
- Backups with tested restore procedures and documented RPO/RTO targets.
- Audit and security logs protected from ordinary tenant mutation.
- Privacy controls: data export, retention policies, account closure workflows and regional legal review.
- Incident response, vulnerability management and dependency scanning before production launch.

Because this product holds financial records, security and auditability are product features, not infrastructure afterthoughts.

16. Pre-Release Development Phases

Phase	Release-gate outcome
Phase 1 — Foundation	Design system; auth; tenancy; organization setup; roles; currencies; taxes; fiscal settings; numbering; audit; ledger design; platform skeleton.
Phase 2 — Sales	Customers; catalog; quotes; sales orders; invoices; recurring invoices; credit notes; manual payments; statements; PDFs/emails.
Phase 3 — Purchases	Vendors; expenses; bills; recurring purchases; purchase orders; vendor credits; payments made; attachments.
Phase 4 — Accounting Engine	Chart of accounts; posting rules; journals; GL; AR/AP; opening balances; period locking; FX; reversals.
Phase 5 — Banking	Financial accounts; statement imports; matching; bank rules; transfers; reconciliation.
Phase 6 — Inventory	Warehouses; stock movements; valuation; adjustments; reorder; COGS; inventory reports.
Phase 7 — Projects & Time	Projects; tasks; time; approvals; billables; project expenses; budgets; profitability.
Phase 8 — Globalization	Country-pack engine; tax/document rules; formats; language infrastructure; structured e-invoice readiness.
Phase 9 — Reporting	Financial statements; operational reports; filters; comparisons; exports; saved/scheduled reports.
Phase 10 — Automation	Recurring jobs; reminders; approval workflows; rule engine; notifications.
Phase 11 — Portals & Collaboration	Customer portal; accountant access; comments/activity; organization switcher.
Phase 12 — Platform Admin	Organizations; plans/entitlements; localization admin; flags; support; operations/security analytics.
Phase 13 — AI Layer	Extraction pipeline; natural-language analytics; explanations; anomaly framework; guarded suggestions.
Phase 14 — Hardening & Release	Accounting QA; security; tenant isolation; performance; accessibility; backups; migration/import; onboarding; documentation; production readiness.

Release policy

All 14 phases are completed before public V1. Internally, each phase must still have its own demo, QA and acceptance gate to prevent a single end-of-project integration crisis.

17. V1 Release Acceptance Criteria

Product

- End-to-end sales and purchase cycles work without payment gateways.
- Organization onboarding can be completed without support.
- Core workflows have empty, loading, error, permission-denied and archived states.

Accounting

- Trial balance always balances.
- AR/AP control accounts reconcile to subledgers.
- Void/reversal and period-lock rules are verified.
- Multi-currency postings and FX behavior pass accountant-reviewed test cases.

Inventory

- Stock cannot change without a traceable movement.
- Inventory valuation reconciles to inventory control account under the chosen policy.

Banking

- Imported statement duplicates are handled.
- Reconciliation can reproduce a statement closing balance and history.

Security

- Cross-tenant access tests pass.
- Critical privilege and financial actions are audited.
- Backup restore has been tested.

Performance

- Large transaction lists are paginated/virtualized.
- Reports use indexed/optimized queries or async generation where needed.
- Background jobs are observable and retry-safe.

Accessibility

- Keyboard navigation and focus states work on critical workflows.
- Forms have programmatic labels and error association.
- Financial tables remain understandable with assistive technology.

Globalization

- Base/transaction currency handling works.
- Country configuration is versioned.
- Unsupported compliance claims are not shown.

Operations

- Admin can identify failed imports/jobs/emails.
- Production monitoring, alerting and incident procedures exist.

18. Post-V1 Expansion

Payments

Introduce a Payment Provider abstraction rather than coupling invoices to one gateway. Provider adapters can later support cards, wallets, bank transfer initiation and regional payment methods. Webhook/event processing must be idempotent and map external payment events into the existing payment/allocation/ledger model.

Other likely expansions

- Live bank feeds/open banking
- Country e-invoicing/tax authority integrations
- Payroll and contractor payments
- Mobile applications
- E-commerce/CRM integrations
- Advanced BI and forecasting
- Multi-entity consolidation
- Fixed assets and depreciation
- Advanced inventory/manufacturing
- Public developer marketplace

19. Implementation Governance

Definition of Done for every module

- Product requirements and edge cases approved.
- UX flows and responsive states designed.
- Permission matrix defined.
- Data model/migrations reviewed.
- Accounting impact explicitly documented where applicable.
- API contract and validation complete.
- Audit events defined.
- Automated unit/integration tests included.
- Accessibility and security checks complete.
- Analytics events defined.
- Documentation and support notes complete.

Recommended delivery rhythm

1. Design the domain and posting rules before UI implementation.
2. Build vertical slices that go from UI through API/database/ledger rather than isolated frontend screens.
3. Use seeded demo organizations to test service, retail and project-based business scenarios.
4. Run accountant-reviewed scenario tests after every accounting-impacting phase.
5. Keep payment-provider code absent from V1 business logic; only retain interfaces/hooks for future expansion.
6. Do not launch until the cross-module reconciliation tests pass.

20. Benchmark & Compliance References

These references informed the scope and global-readiness recommendations. They are benchmarks, not implementation specifications; jurisdiction-specific compliance still requires professional review.

Blueprint decision summary

Decision	V1
Market	Global
Product type	Full accounting + invoicing + business finance
Platform	Responsive web application
Architecture	Multi-tenant, modular, ledger-first
Accounting	Double-entry, accrual-first
Currencies	Multi-currency
Localization	Country-pack framework
Payments	Manual recording only; gateway integrations deferred
Banking	Statement import + reconciliation; live feeds deferred
Inventory	Included
Projects/time	Included
Portals	Customer + accountant included
AI	Foundation and selected guarded features included
Public launch gate	All 14 pre-release phases complete
